How to use/Example table

INTRODUCTION:

The life cycle of a plant can be divided in two main stages, the vegetative growth period and the flowering period.

Both stages can be subclassified into different stages with different needs.

VEGETATIVE GROWTH PHASE:

1.) Seedling stage (< 6")

2.) Young plant & rooted cuttings (6-10")

3.) Maturing plant (10-14")

4.) Mature plant (>14")

FLOWERING PHASE:

1.) Pre-flowering / Transition to flowering (week 1-3)

2.) Flower formation and growth (week 3-6)

3.) Ripening of flowers (week 7+)

Stages of the vegetative growth

Stages of the flowering cycle

IMPORTANT!

- The values in the following tables are calculated using water with EC 0.0

- The pH value may decrease depending on water quality and temperatures

- When adding Calcium the PH values may increase depending on water quality and temperatures

- Do not use CalMag with our mineral line. Calcium Nitrate is partly incompatible with Monopotassium Phosphate and Magnesium Sulfate and may result in formation of gypsum, clogging pipes or creating deficiencies

- Our mineral plant nutrients do not contain calcium, which means that if you use very soft water, rainwater or osmotic water, calcium needs to be added

- Keep the nutrient solution between 65 - 72 degrees F

- Control the EC of the runoff and flush if it's higher than EC 2.5 (1250ppm)

- For best results maintain a pH value between:

  > Soil: 6.0 - 6.5

  > Hydro/Coco: 5.8 - 6.2

  > Rockwool: 5.5 - 6.0
